Issue no. 119 / June 2015

Subject: Tough Conditions Crop Flow Improvement Kit PN 1816 934.0

From: COA Product Management

In conjunction with product bulletin *lex_pb116 Threshing Components of LEXION combines* and *lex_pb114 HD Impeller Wear Parts* there is now an additional tough conditions flow kit available for installation on the threshing drum, complete **kit number through CLAAS Parts is 1816 934.0**

The kit is useable on closed threshing drums only. Threshing drums of the newer style (*with openings along the rasp bars as explained in lex_pb104*) offer convenient bolt-on installation. Prior threshing drums require drilling of holes, using the included template.

For installation instructions, please reference **Service Information 12787 – Closed Threshing Drum – Installing V-Plates.**

Initial test have shown major improvements in tough, green crop conditions. The v-vanes installed on the threshing drum help split the material for improved feed into the HYBRID PLUS twin rotor separation system, preventing potential back-feeding of the impeller. There is no benefit for walker machines.
